Air Turnover System Application Guide

Applied Air

In the business of commercial warehouse and distribution, efficient and low-cost heating and cooling is essential. Applied Air keeps you warm for less.

Since 1975, Applied Air has been providing cost-effective, reliable heating solutions. Our Air Turnover System brings warm air down to your work environment for less than the operation and maintenance costs of unit heaters, radiant panels or overhead heating systems.

This Application Guide will help you choose an Applied Air Air Turnover System to provide efficient, cost-effective heating and cooling for your warehouse or distribution operation. The Guide covers:

- Heating Needs Identify heating needs for your specific facilities.
- Technical Specifications Configure the right system components (e.g., motors, drive, filter, options, etc.) to meet your needs.
 Model IFP Standard Indirect Fired Air Turnover
 Model IFS "Support" Unit, without Gas Heat
 Model CAT Standard Cooling Only Air Turnover with Prop Fans
 Model IFA Standard Cooling Air Turnover plus Optional Indirect Fired Gas Heat
 Model IFJ Smaller Indirect Fired Air Turnover with Optional Cooling Coil
- Installation Information Plan details of on-site installation.

If you have questions, please contact Applied Air's Customer Service Department at 214-638-6010. We'll be glad to help.

(1) Base unit priced by motor HP for each model.

(2) For large spaces with low heat requirements, combine Heating Units and Support Units.

(4) Upper number indicates lowest full output and bottom number indicates maximum full output available for each model.

(3) Typical amps shown are based on 460V power supply. For 230V power supply, multiply above amps x 2.0. For 208V power supply, multiply above amps x 2.2.

⁽⁵⁾ Indicates temperature rise for outputs at CFM shown. Order stainless steel heat exchangers when 30% or more of winter outside air is introduced, or temperature rise at minimum firing rate is below 10°F.

(1) Base unit priced by motor HP for each model.

(2) For large spaces with low heat requirements, combine Heating Units and Support Units.

(3) Upper number indicates lowest full output and bottom number indicates maximum full output available for each model.

(4) Typical amps shown are based on 460V power supply. For single phase motors, the load is based on control transformer sized to handle burner and/or draft inducer motors.

(5) Typical amps shown are based on 460V power supply. For 230V power supply, multiply above amps x 2.0. For 208V power supply, multiply above amps x 2.2.

(6) Gas pipe size is based on standard manifold with 8" to 14" W.C. gas pressure.

(1) Base unit priced by CFM and matching coil size.

- (2) Typical amps shown are based on 460V power supply. For 230V power supply, multiply above amps x 2.0. For 208V power supply, multiply above amps x 2.2.
- (3) Nominal cooling capacity based on DX coils with 2) 4 Row coils in "A" arrangement, 45° Suction temperature and 80°/67° return air temperature. See CW Coil Data for CW capacities.
- (4) Upper number indicates lowest full output and bottom number indicates maximum full output available for each model.
- (5) Indicates temperature rise for outputs at CFM shown. Order stainless steel heat exchangers when 30% or more of winter outside air is introduced, or temperature rise at minimum firing rate is below 10°F.

Gas Piping Layout

45

Equipment Sizing

Hilling Applied Air

Selection Procedure

Sizing Air Turnover systems depends upon several factors:

- Building height
- Building heating or cooling load
- Number and useage of openings to outdoors
- Acceptable floor to ceiling temperature spread
- Net building volume
- Fill factor

Equipment Selection

This process is best illustrated by an example.

Problem

Heat a 220' x 250' x 26' dry storage warehouse building. 10% of the space is occupied by inventory. Fuel will be natural gas. Heat loss has been calculated at 1,250,000 Btu/hr.

Solution

Step 1

SCFM = $\frac{\text{Total Btu/hr}}{30^{\circ}\text{F Temp Rise x 1.085}}$

SCFM with 30°F TR = 38,402

NOTE

Temperature rise should not exceed 30°F for a straight heating application. If the unit will also provide make-up air, this may be increased to 45°F when 25% or more outside air is used.

Temperature drop should not exceed 15°F for cooling applications

Step 2

If temperature spread from floor to ceiling is not a concern, select one model GHLIFP-250/175 with 1,250,000 Btu/hr output, delivering 39,000 SCFM.

If floor to ceiling temperature spread is a concern, go to next step.

Step 3

Total building area is 55,000 square feet.

Step 4

55,000 square feet x 26' (ceiling height) x 0.90 (% of building not filled).

Step 5

Net building voulume is 1,287,000 cubic feet.

Step 6

Reference Air Turnover Charts below. Generally; the higher the Air Turnover/hr, the lower the floor to ceiling spread.

Step 7

SCFM =
$$\frac{\text{Net building volume x AT/H}}{60}$$

SCFM with 2.25 AT/H = 48,263

Select one model GHLIFP-300/175 with 1,250,000 Btu/hr output, delivering 49,000 SCFM.

IFP Guide Specifications

IIIIIIIII Applied Air

Base Bid Applied Air Model IFP

indirect fired heating Air Turnover Unit(s) designed to draw return air at floor level and discharge heated air near the ceiling. The unit shall be factory fabricated, assembled, wired and tested prior to shipment in accordance with the specification and equipment schedule. The unit will include all components herein and as shown on the drawings. Alternate equipment, equal in design, construction, performance and capacity to unit(s) specified, must be shown with price deduct/add, if any. Approval of alternate equipment will be subject to review of shop drawings. The unit shall be capable of delivering______SCFM using ______ horsepower (ODP) (TEFC) motors operating on (208)(230)(460)/3/60. The unit shall be ETL listed.

CASING

The unit casing shall consist of 18 gauge galvanized steel panels over a structural steel framework to ensure rigidity. Cabinet construction shall allow unit(s) to be mounted in the vertical arrangement with no external framework. The casing enclosing the heat exchanger shall be of double wall construction with a galvanized steel inner wall serving as a radiation shield. Radiation and transmission losses shall not exceed 2% of the rated output.

PROPELLER SECTION

Each unit shall be supplied with multiple belt driven turbine fourbladed energy efficient propeller fans rated in accordance with AMCA standards. Each propeller fan will be driven by a three phase high efficiency motor mounted on an adjustable base. The propellers are to be mounted on heavy duty, turned and ground and polished solid steel shafts designed for a maximum operating speed not to exceed 75% of its first critical speed.

The bearings are to be of the heavy-duty industrial pre-lubricated, self aligning type equipped with extended lube lines to control side of unit.

Drives shall have a capacity 25% greater than the motor horsepower. The motor sheave shall be of the adjustable pitch type for motors up to $71/_{2}$ H.P.

Each propeller fan motor shall be mounted on an adjustable base and wired in flexible conduit to the control panel in the factory.

Unit shall have low velocity return air section at floor level with screens on four sides.

Hinged access door, with cadmium plated piano type hinges, into return air section shall be supplied to allow physical entry for required inspections and periodic maintenance. Access door shall be complete with door latches, fasteners, and keyed lock to prevent unauthorized entry. An access door interlock switch, which will break power to propeller fans upon entry, will be provided as safety control.

INDIRECT GAS FIRED SECTION

The entire primary heat transfer surface and header shall be of 400 series stainless steel; the secondary heat transfer surface shall be (mild steel) (400 series stainless steel). The heat exchanger design shall permit unrestricted lateral and peripheral expansion during the heating and cooling cycle. The flue gas travel shall be of four-pass design, with no internal baffles. The surface temperature of the heat exchanger shall not exceed 75% of its scaling temperature when operating at rated capacity. The heat exchanger shall be rated at a minimum of 80% efficiency at rated output. A pressure relief door complete with an observation window to view the complete flame and pilot shall be provided.

DIRECT DRIVE INDUCED DRAFT FAN

An integrally mounted, heavy duty, non-clogging radial blade induced draft fan complete with direct drive motor shall be provided. The induced draft fan shall be adequately sized to insure proper draft conditions when operating at rated capacity and equipped with a manual damper complete with locking quadrant to ensure proper draft and extended heat exchanger performance.

BURNER

The gas burner shall be of the power type, complete with integral combustion air blower and motor, combustion air proving switch, and removable pilot assembly. The combustion air damper shall be inter-locked with the gas control valve to insure a proper gas/air mixture throughout the complete range of operation. Burner and controls shall be capable of delivering ______MBH output firing on (natural gas) (propane) at an inlet pressure of ______ (inches water column) (PSIG) and in accordance with (manufacturer's standard) (FM) (IRI) requirements. Burner and controls shall be arranged for (High/Low/Off) (Full Modulation with low fire start) with factory mounted return air thermostat The factory mounted, wired and piped valve train shall be complete with:

- low pressure appliance regulator
- motorized gas control valve
- main manual test firing shut-off valve
- pilot manual shut-off valve
- pilot pressure regulator
- pilot automatic shut-off valve
- pilot manual test firing shut-off valve

IFP Guide Specifications

IIIIIIII Applied Air

DISCHARGE PLENUM

Unit shall have low velocity discharge air plenum with screens on three sides.

ELECTRICAL CONTROLS

A NEMA 1 control panel complete with hinged access door shall be mounted on unit. All control components are to be labeled and individually wired to a numbered terminal strip to aid in servicing. All wiring shall be color coded and number tagged at each end to match the control diagram supplied. Full operating and maintenance instructions shall accompany each unit. All wiring between the controls and valves shall be run in flexible conduit. All electrical components shall bear the U.L. label. The control system shall include but not be limited to the following components required for automatic operation:

- control circuit transformer
- fan motor starters, overloads and sub-circuit fuses
- control circuit fuses
- control relays
- circuit analyzer troubleshooting lights
- electronic flame relay complete with alarm contacts
- induced draft fan air proving differential switch
- high limit switch
- automatic/manual fan switch
- heavy duty ignition transformer

- Alternate arrangement with one factory mounted damper for 0 - 25% of winter outside air with (two position) (modulating) motor(s).
- Alternate arrangement with two factory mounted mixing dampers for 0 100% control of winter outside air with (two position) (modulating) motor(s).
- 3. Four sided flat bank permanent filters for filtering 100% return air.
- 4. V-Bank filter section with nominal 2" thick cleanable filters.
- 5. Discharge plenum with screens on four sides.
- 6. Discharge plenum extension.
- 7. Six bladed propeller fans
- 8. VFD for fan motors.
- 9. Clogged filter switch and indicating light.
- 10. Disconnect switch
- 11. Painted galvanized casing
- High gas pressure regulator (shipped loose for inlet pressures over 1 PSIG).
- 13. Remote control panel.
- 14. Night set back thermostat
- 15. Electronic time clock
- 16. Timed freeze protection
- 17. Smoke detector
- 18. Mixed air temperature controller for mixing dampers.
- 19. Manual potentiometer controller for mixing dampers.
- 20. Pressure control system for mixing dampers.
- 21. AdaptAire DDC Control System.

Each unit shall be supplied with multiple belt driven turbine fourbladed energy efficient propeller fans rated in accordance with AMCA standards. Each propeller fan will be driven by a three phase high efficiency motor mounted on an adjustable base. The propellers are to be mounted on heavy duty, turned and ground and polished solid steel shafts designed for a maximum operating speed not to exceed 75% of its first critical speed.

The bearings are to be of the heavy-duty industrial pre-lubricated, self aligning type equipped with extended lube lines to control side of unit.

Drives shall have a capacity 25% greater than the motor horsepower. The motor sheave shall be of the adjustable pitch type for motors up to $71/_2$ H.P.

Each propeller fan motor shall be mounted on an adjustable base and wired in flexible conduit to the control panel in the factory.

Unit shall have low velocity return air section at floor level with screens on four sides.

Hinged access door, with cadmium plated piano type hinges, into return air section shall be supplied to allow physical entry for required inspections and periodic maintenance. Access door shall be complete with door latches, fasteners, and keyed lock to prevent unauthorized entry. An access door interlock switch, which will break power to propeller fans upon entry, will be provided as safety control.

DISCHARGE PLENUM

Unit shall have low velocity discharge air plenum with screens on three sides.

ELECTRICAL CONTROLS

A NEMA 1 control panel complete with hinged access door shall be mounted on unit. All control components are to be labeled and individually wired to a numbered terminal strip to aid in servicing. All wiring shall be color coded and number tagged at each end to match the control diagram supplied. Full operating and maintenance instructions shall accompany each unit. All wiring between the controls shall be run in flexible conduit. All electrical components shall bear the U.L. label. The control system shall include but not be limited to the following components required for automatic operation:

- control circuit transformer
- fan motor starters, overloads and sub-circuit fuses
- control circuit fuses
- control relays
- circuit analyzer troubleshooting lights

- Alternate arrangement with one factory mounted damper for 0 - 25% of winter outside air with (two position) (modulating) motor(s).
- Alternate arrangement with two factory mounted mixing dampers for 0 - 100% control of winter outside air with (two position) (modulating) motor(s).
- 3. Four sided flat bank permanent filters for filtering 100% return air.
- 4. V-Bank filter section with nominal 2" thick cleanable filters.
- 5. Discharge plenum with screens on four sides.
- 6. Discharge plenum extension.
- 7. Six bladed propeller fans
- 8. VFD for fan motors.
- 9. Clogged filter switch and indicating light.
- 10. Disconnect switch
- 11. Painted galvanized casing
- 12. Remote control panel.
- 13. Night set back thermostat
- 14. Electronic time clock
- 15. Smoke detector
- 16. Mixed air temperature controller for mixing dampers.
- 17. Manual potentiometer controller for mixing dampers.
- 18. Pressure control system for mixing dampers.
- 19. AdaptAire DDC Control System.

CAT Guide Specifications

Applied Air

Base Bid Applied Air Model CAT Air Turnover Cooling Unit(s) designed to draw return air at floor level and discharge conditioned air near the ceiling. The unit shall be factory fabricated, assembled, wired and tested prior to shipment in accordance with the specification and equipment schedule. The unit will include all components herein and as shown on the drawings. Alternate equipment, equal in design, construction, performance and capacity to unit(s) specified, must be shown with price deduct/add, if any. Approval of alternate equipment will be subject to review of shop drawings. The unit shall be capable of delivering SCFM with tons cooling with (DX)(CW) coils using HP (ODP) (TEFC) motors operating on two (2) (208)(230)(460)/3/60. The unit shall be ETL listed.

CASING

The unit casing shall consist of 18 gauge galvanized steel panels over a structural steel framework to ensure rigidity. Cabinet construction shall allow unit(s) to be mounted in the vertical arrangement with no external framework.

Hinged access doors with cadmium plated piano type hinges shall be supplied to allow physical entry to all sections requiring inspections and periodic maintenance. Access doors shall be complete with 1'' thick insulation, interior metal liner, captive screws, fasteners, and handles.

Unit shall be complete with V-Bank filter section with nominal 2'' thick (throwaway) (pleated) (cleanable) filters to protect the cooling coils.

All sections downstream of the cooling coils will be insulated with 1", 1-1/2# fiberglass insulation pin-spotted to unit casing.

Unit shall have low velocity return air section at floor level with screens on four sides.

PROPELLER SECTION

Each unit shall be supplied with multiple belt driven turbine bladed energy efficient propeller fans rated in accordance with AMCA standards. Each propeller fan will be driven by a three phase high efficiency motor mounted on an adjustable base. The propellers are to be mounted on heavy duty, turned, ground and polished solid steel shafts designed for a maximum operating speed not to exceed 75% of its first critical speed.

The bearings are to be of the heavy-duty industrial pre-lubricated, self aligning type equipped with extended lube lines to control side of unit.

Drives shall have a capacity 25% greater than the motor horsepower. The motor sheave shall be of the adjustable pitch type for motors up to 7-1/2 HP.

Each propeller fan motor shall be mounted on an adjustable base and wired in flexible conduit to the control panel in the factory.

COOLING COIL SECTION

Two four row (DX) (CW) cooling coils with 5/8'' seamless copper tubes, aluminum fins and galvanized steel casing. Headers are to be made of non-ferrous material with vents, drains and suitable for 200 psi working pressure. Coils shall be mounted in an "A" arrangement with insulated stainless steel drain pan under each coil. Coil velocity shall not exceed 550 FPM. Section will be furnished with 1", 1-1/2# fiberglass insulation pin-spotted to unit casing.

DISCHARGE PLENUM

A discharge plenum with aluminum high velocity discharge grilles on three sides will be provided. The plenum will be furnished with 1", 1-1/2# fiberglass insulation pin-spotted to unit casing. Discharge grilles shall be sized at the factory to provide discharge velocity required for proper air circulation in conditioned space.

ELECTRICAL CONTROLS

A NEMA 1 control panel complete with hinged access door shall be mounted on unit. All control components are to be labeled and individually wired to a numbered terminal strip to aid in servicing. All wiring shall be color coded and number tagged at each end to match the control diagram supplied. Full operating and maintenance instructions shall accompany each unit. All wiring between controls shall be run in flexible conduit. All electrical components shall bear the U. L. label. The control system shall include but not be limited to the following components required for automatic operation:

- control circuit transformer
- fan motor starters, overloads and sub-circuit fuses
- control circuit fuses
- control relays

- One factory mounted damper for 0 25% of outside air with (two position) (modulating) motor(s).
- Two factory mounted mixing dampers for 0 100% control of outside air with (two position) (modulating) motor(s).
- 3. Mixed air temperature controller for mixing dampers.
- 4. Manual potentiometer controller for mixing dampers.
- 5. Pressure control system for mixing dampers.
- Insulated Discharge Plenum Extension with 1", 1-1/2# fiberalass insulation pin-spotted to unit casing.
- Discharge Plenum with aluminum high velocity discharge grilles on 4 sides.
- 8. VFD for fan motors.
- 9. Clogged filter switch and indicating light.
- 10. Non-Fused disconnect switch.
- 11. Painted galvanized casing.
- 12. Circuit analyzer trouble shooting lights.
- 13. Electronic time clock.
- 14. Remote control panel.
- 15. On-Off night setback thermostat.
- 16. Smoke detector.
- 17. AdaptAire DDC Control System.

IFA Guide Specifications

Applied Air

Base Bid Applied Air Model IFA

Air Turnover (Heating and Cooling) (Cooling) Unit(s) designed to draw return air at floor level and discharge conditioned air near the ceiling. The unit shall be factory fabricated, assembled, wired and tested prior to shipment in accordance with the specification and equipment schedule. The unit will include all components herein and as shown on the drawings. Alternate equipment, equal in design, construction, performance and capacity to unit(s) specified, must be shown with price deduct/add, if any. Approval of alternate equipment will be subject to review of shop drawings. The unit shall be capable of delivering ______ SCFM with ______ tons cooling with (DX) (CW) coils using a ______ horsepower (ODP) (TEFC) motor operating on (208)(230)(460)/3/60. The unit shall be ETL listed.

CASING

The unit casing shall consist of 18 gauge galvanized steel panels over a structural steel framework to ensure rigidity. Cabinet construction shall allow unit(s) to be mounted in the vertical arrangement with no external framework.

Hinged access doors with cadmium plated piano type hinges shall be supplied to allow physical entry to all sections requiring inspections and periodic maintenance. Access doors shall be complete with 1'' thick insulation, interior metal liner, captive screws, fasteners, and handles.

Unit shall be complete with V-Bank filter section with nominal 2" thick (throwaway) (pleated) (cleanable) filters to protect the cooling coils.

The inlet section shall have screened return air openings on the two long sides of unit at floor level.

BLOWER SECTION

Each unit shall be supplied with three centrifugal forward curve, DWDI blowers rated in accordance with AMCA standards. The blowers are to be mounted on a heavy duty, turned and ground and polished solid steel shaft designed for a maximum operating speed not to exceed 75% of its first critical speed.

The bearings are to be of the heavy-duty industrial pre-lubricated, self aligning type. All models will have a double row spherical roller bearing on drive side.

Drives shall have a capacity 25% greater than the motor horsepower. Blower and motor sheaves shall be laser aligned to provide maximum belt and sheave life. The motor sheave shall be of the adjustable pitch type for motors up to $7^{1}/_{2}$ H.P.

The high efficiency fan motor shall be mounted on an adjustable base and wired in flexible conduit to the control panel in the factory. All units will be laser aligned in the factory to provide minimum vibration and maximum bearing life. The shaft and bearings shall be laser aligned at the factory to ensure straightness. The fan wheel, shaft, drives, and motor assembly shall be vibration balanced as a complete assembly in the factory.

INDIRECT GAS FIRED SECTION (Optional)

The entire primary heat transfer surface and header shall be of 400 series stainless steel; the secondary heat transfer surface shall be (mild steel) (400 series stainless steel). The heat exchanger design shall permit unrestricted lateral and peripheral expansion during the heating and cooling cycle. The flue gas travel shall be of four-pass design, with no internal baffles. The surface temperature of the heat exchanger shall not exceed 75% of its scaling temperature when operating at rated capacity. The heat exchanger shall be rated at a minimum of 80% efficiency at rated output. A pressure relief door complete with an observation window to view the complete flame and pilot shall be provided.

The casing enclosing the optional heat exchanger shall be of double wall construction with a galvanized steel inner wall serving as a radiation shield. Radiation and transmission losses shall not exceed 2% of the rated output. This section shall be insulated with 1", $1^{1}/_{2}$ lb. density insulation.

DIRECT DRIVE INDUCED DRAFT FAN (Optional)

An integrally mounted, heavy duty, non-clogging radial blade induced draft fan complete with direct drive motor shall be provided. The induced draft fan shall be adequately sized to insure proper draft conditions when operating at rated capacity and equipped with a manual damper complete with locking quadrant to ensure proper draft and extended heat exchanger performance.

BURNER (Optional)

The gas burner shall be of the power type, complete with integral combustion air blower and motor, combustion air proving switch, and removable pilot assembly. The combustion air damper shall be inter-locked with the gas control valve to insure a proper gas/air mixture throughout the complete range of operation. Burner and controls shall be capable of delivering ______MBH output firing on (natural gas) (propane) at an inlet pressure of ______ (inches water column) (PSIG) and in accordance with (manufacturer's standard) (FM) (IRI) requirements. Burner and controls shall be arranged for (High/Low/Off) (Full Modulation with low fire start).

The factory wired and piped valve train shall be complete with:

- low pressure appliance regulator
- motorized gas control valve
- main manual test firing shut-off valve
- pilot manual shut-off valve
- pilot pressure regulator
- pilot automatic shut-off valve
- pilot manual test firing shut-off valve

IFA Guide Specifications

H**HHHH** Applied Air

COOLING COIL SECTION

Two four row (DX) (CW) cooling coils with copper tubes, aluminum fins and galvanized steel casing. Headers to be non-ferrous with vents, drains and suitable for 200 psi working pressure. Coils shall be mounted in an "A" coil arrangement with insulated stainless steel drain pan under each coil. Coil velocity shall not exceed 550 FPM. Section will be furnished with 1", $11/_2$ # fiberglass insulation pin-spotted to casing.

Units without optional heat section will be provided with a diffuser section between blower section and coil section.

DISCHARGE PLENUM

A discharge plenum with aluminum high velocity discharge grilles on three sides will be provided. The plenum will be furnished with 1", $1^{1}/_{2}$ # fiberglass insulation pin-spotted to casing. Discharge grilles shall be sized at the factory to provide discharge velocity required for proper air circulation in conditioned space.

ELECTRICAL CONTROLS

A NEMA 1 control panel complete with hinged access door shall be mounted on unit. All control components are to be labeled and individually wired to a numbered terminal strip to aid in servicing. All wiring shall be color coded and number tagged at each end to match the control diagram supplied. Full operating and maintenance instructions shall accompany each unit. All wiring between controls shall be run in flexible conduit. All electrical components shall bear the U.L. label. The control system shall include but not be limited to the following components required for automatic operation:

- control circuit transformer
- fan motor starters, overloads and sub-circuit fuses
- control circuit fuses
- control relays

With optional gas heat section

- · electronic flame relay complete with alarm contacts
- induced draft fan air proving differential switch
- high limit switch
- automatic/manual fan switch
- heavy duty ignition transformer

- One factory mounted damper for 0 25% of winter outside air with (two position) (modulating) motor(s).
- Two factory mounted mixing dampers for 0 100% control of winter outside air with (two position) (modulating) motor(s).
- Insulated Discharge Plenum Extension with 1", 1¹/₂ # fiberglass insulation pin-spotted to casing.
- 4. Insulated blower section with 1", $1^1/_2$ # fiberglass insulation pin-spotted to casing.
- Insulated inlet section with 1", 1¹/₂ # fiberglass insulation pinspotted to casing.
- Insulated diffuser section with 1", 1¹/₂ # fiberglass insulation pin-spotted to casing.
- Discharge plenum with aluminum high velocity discharge grilles on 4 sides
- 8. Extended lube lines
- 9. Internal blower/motor isolation
- 10. VFD for blower motor
- 11. Clogged filter switch and indicating light.
- 12. Disconnect switch
- 13. Painted galvanized casing
- High gas pressure regulator (shipped loose for inlet pressures over 1 PSIG).
- 15. Circuit analyzer trouble shooting lights
- 16. Electronic time clock
- 17. Remote control panel.
- 18. Timed freeze protection
- 19. On-Off night setback thermostat
- 20. Smoke detector
- 21. Mixed air temperature controller for mixing dampers.
- 22. Manual potentiometer controller for mixing dampers.
- 23. Pressure control system for mixing dampers.
- 24. AdaptAire DDC Control System.

IFJ Guide Specifications

Hilling Applied Air

Base Bid Applied Air Model IFJ

(Single) (Double) Air Turnover (Heating) (Heating and Cooling) unit(s) designed to draw return air at floor level and discharge conditioned air near the ceiling. The unit shall be factory fabricated, assembled, wired and tested prior to shipment in accordance with the specification and equipment schedule. The unit will include all components herein and as shown on the drawings. Alternate equipment, equal in design, construction, performance and capacity to unit(s) specified, must be shown with price deduct/add, if any. Approval of alternate equipment will be subject to review of shop drawings. The unit shall be capable of delivering______SCFM using a ______ horsepower ODP motor operating on (115)(230)/1/60 or (208)(230)(460)/3/60.

CASING

The unit casing shall consist of formed 20 gauge galvanized steel panels suitably reinforced to ensure rigidity. Cabinet construction shall allow unit(s) to be mounted in the vertical arrangement with no external framework.

The inlet section shall have screened and filtered low velocity return air openings on unit at the floor level.

AIR MOVING SECTION (Choose one)

Propeller Model — Each unit shall be supplied with direct drive four-bladed energy efficient propeller fan rated in accordance with AMCA standards. Each propeller fan will be driven by (single) (three) phase motor.

Propeller fan motor shall be mounted on an solid base and wired in flexible conduit to the control panel in the factory.

Blower Model — Each unit shall be supplied with centrifugal forward curve, DWDI blower rated in accordance with AMCA standards. The blower is to be mounted on a heavy duty, turned and ground and polished solid steel shaft designed for a maximum operating speed not to exceed 75% of its first critical speed.

The bearings are to be of the heavy-duty industrial pre-lubricated, self aligning type.

Drives shall have a capacity 25% greater than the motor horsepower. The motor sheave shall be of the adjustable pitch type.

The fan motor shall be mounted on an adjustable base and wired in flexible conduit to the control panel in the factory.

INDIRECT GAS FIRED SECTION

The entire primary heat transfer surface, headers, and secondary heat transfer surface shall be of 400 series stainless steel. The heat exchanger design shall permit unrestricted lateral and peripheral expansion during the heating and cooling cycle. The flue gas travel shall be of three-pass design, with no internal baffles. The surface temperature of the heat exchanger shall not exceed 75% of its scaling temperature when operating at rated capacity. The heat exchanger shall be rated at a minimum of 80% efficiency at rated output. A pressure relief door complete with an observation window to view the complete flame and pilot shall be provided.

BURNER

The gas burner shall be of the power type, complete with combination redundant gas valve, ignition control package, integral combustion air blower with totally enclosed motor, integral combustion air proving switch, and removable "gas gun" assembly. The primary air adjustment control shall be on outside of burner with indicator for easy flame adjustment. Burner and controls shall be capable of delivering _______MBH output firing on (natural gas) (propane) at an inlet pressure of _______ (inches water column) (PSIG) and in accordance with manufacturer's standard requirements. Burner and controls shall be arranged for On-Off control.

COOLING COIL SECTION

Two three row (DX) (CW) cooling coils sized for ______tons cooling with copper tubes, aluminum fins and galvanized steel casing. Headers to be non-ferrous with vents, drains and suitable for 200 psi working pressure. Coils shall be mounted in an "A" coil arrangement with insulated stainless steel drain pan under each coil. Coil velocity shall not exceed 520 FPM. Section will be furnished with 1", $11/_2$ # fiberglass insulation pin-spotted to casing.

DISCHARGE PLENUM (Choose one)

Heating Model – Unit shall have low velocity discharge air plenum with screens on three sides.

Heating and Cooling Model – A discharge plenum with aluminum high velocity discharge grilles on three sides will be provided. The plenum will be furnished with 1'', $1^1/_2$ # fiberglass insulation pin-spotted to casing. Discharge grilles shall be sized at the factory to provide discharge velocity required for proper air circulation in conditioned space.

Hilling Applied Air

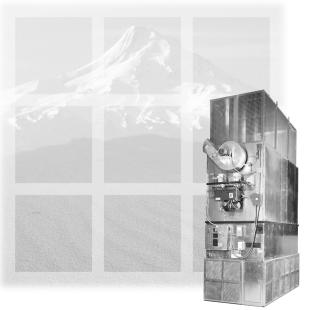

ELECTRICAL CONTROLS

A NEMA 1 control panel complete with hinged access door shall be mounted on unit. All control components are to be labeled and individually wired to a numbered terminal strip to aid in servicing. All wiring shall be color coded and number tagged at each end to match the control diagram supplied. Full operating and maintenance instructions shall accompany each unit. All wiring between the controls shall be run in flexible conduit. All electrical components shall bear the U.L. label. The control system shall include but not be limited to the following components required for automatic operation:

- control circuit transformer
- fan motor starters, overloads and sub-circuit fuses
- control circuit fuses
- control relays
- electronic flame supervision
- high limit switch
- heavy duty ignition transformer

- One factory mounted damper for 0 25% of winter outside air with two position motor.
- Two factory mounted mixing dampers for 0 100% control of winter outside air with two position motor(s).
- 3. Discharge Plenum Extension
- 4. Disconnect switch
- Field mounted, heavy duty, non-clogging blade draft inducer fan complete with direct drive motor.
- 6. Painted galvanized casing
- High gas pressure regulator (shipped loose for inlet pressures over ¹/₂ PSIG).
- 8. Electronic time clock
- 9. Timed freeze protection
- 10. On-Off night setback thermostat
- 11. Smoke detector
- 12. Discharge plenum with four sided discharge.

Applied Air

Efficient Gas-Fired Heating Systems

Choose Applied Air Gas Fired Air Turnover systems for Your Warehouse

- Heat large or small spaces efficiently by "reclaiming" stratified heat
- Constantly recirculate room air for even temperature distribution
- Eliminate cold floor condensation
- Low operating and maintenance costs
- Optional DX or chilled water cooling
- Simple, inexpensive installation
- Applied Air, a leader in research, engineering, and customer service since 1975
- AMCA standards to insure rated airflow
